

Submission Worksheet

Submission Data

Course: IT202-008-S2026

Assignment: IT202 - Milestone 3

Student: Deep S. (dns33)

Status: Submitted | **Worksheet Progress:** 100%

Potential Grade: 10.00/10.00 (100.00%)

Received Grade: 0.00/10.00 (0.00%)

Started: 5/2/2026 4:35:06 PM

Updated: 5/4/2026 5:06:25 PM

Grading Link: <https://learn.ethereallab.app/assignment/v3/IT202-008-S2026/it202-milestone-3/grading/dns33>

View Link: <https://learn.ethereallab.app/assignment/v3/IT202-008-S2026/it202-milestone-3/view/dns33>

Instructions

1. Refer to Milestone3 of this doc:
<https://docs.google.com/document/d/1XE96a8DQ52Vp49XACBDTNCq0xYDt3kF29cO88EWVwfo/view>
2. Ensure you read all instructions and objectives before starting.
3. Ensure you've gone through each lesson related to this Milestone
4. Switch to the Milestone3 branch
 1. `git checkout Milestone3` (ensure proper starting branch)
 2. `git pull origin Milestone3` (ensure history is up to date)
5. Fill out the worksheet below
 - Ensure there's a comment with your UCID, date, and brief summary of the snippet in each screenshot
 - Ensure proper styling is applied to each page
 - Ensure there are no visible technical errors; only user-friendly messages are allowed
6. Once finished, click "Submit and Export"
7. Locally add the generated PDF to a folder of your choosing inside your repository folder and move it to GitHub
 1. `git add .`
 2. `git commit -m "adding PDF"`
 3. `git push origin Milestone3`
 4. On GitHub merge the pull request from Milestone3 to qa
 5. On GitHub create a pull request from qa to prod and immediately merge. (This will trigger the prod deploy to make the Render.com prod links work)
8. Upload the same PDF to Canvas
9. Sync Local
10. `git checkout qa`
11. `git pull origin qa`

Section #1: (3 pts.) Api Data

Progress: 100%

⇒ Task #1 (1 pt.) - Concept of Data Association

Details:

- What is the concept of your data association to users? (examples: favorites, wish list, purchases, assignment, etc)
- Describe with a few sentences

Your Response:

My data association is a watchlist/favorites feature for YouTube videos. A logged-in user can save any video from the main Videos list to their personal watchlist. This is implemented as a many-to-many relationship between Users and Videos using an association table (IT202_M3_UserYTVideos), so each user can save many videos and each video can be saved by many users. Users can toggle Save/Unsave at any time, which adds/removes the relationship without deleting the video record.

Saved: 5/4/2026 2:28:34 PM

≡ Task #2 (1 pt.) - Data Updates

Progress: 100%

Details:

- When an associated entity is updated (manually or via API), how is the association affected?
 - Does the user see the old version of the data?
 - Does the user see the new version of the data?
 - Does the user need to have data re-associated or remapped?
- Explain why.

Your Response:

When a video entity is updated (either manually by Admin or refreshed from the API), the association is not broken because the user is associated to the local DB video record (IT202_M2_YT_Videos.id) through the join table. Users will see the new version of the data automatically (updated title, views text, etc.) because the watchlist page always joins to the current row in IT202_M2_YT_Videos. No remapping is needed because the association uses the stable local primary key, not the external YouTube video_id string

Saved: 5/4/2026 2:28:42 PM

≡ Task #3 (1 pt.) - Handling Association

Progress: 100%

Part 1:

Progress: 100%

Details:

- Show an example page of where a user can get data associated with them
- Ensure the Render.com qa URL is visible
- Caption if this is a user-facing page or admin page
- Include screenshots of code related to this logic including the database query

User-facing page: users save/unsave videos to their watchlist

 Saved: 5/4/2026 2:36:03 PM

⇒ Part 2:

Progress: 100%

Details:

- Include the pull request link for this feature
- Include the Render.com prod link to this page that triggers and handles this logic

URL #1

<https://github.com/shahdp2/IT202-SP2026/pull/131>

URL

<https://github.com/shahdp2/IT20>

URL #2

URL

<https://dns33-it202-008-qa.onrenc>

 Saved: 5/4/2026 2:36:03 PM

≡ Part 3:

Progress: 100%

Details:

- Describe the process of associating data with the user.
- Can it be toggled, or is it applied once?

Your Response:

Users associate videos to themselves through the Save/Unsave action on the Videos browse page. When a user clicks Save, the app creates a row in the join table IT202_M3_UserYTVideos (user_id + yt_video_id) or re-activates it if it already exists. When the user clicks Unsave, the relationship is removed (either by setting is_active = 0 if you're doing soft delete, or deleting the row if you chose hard delete). So, the association is toggle-based, not one-time. Users can save a video, remove it later, and save it again at any time.

Saved: 5/4/2026 2:36:03 PM

Section #2: (6 pts.) Associations

Progress: 100%

≡ Task #1 (1.50 pts.) - Logged-in User's Associated Entities

Progress: 100%

Details:

- Each line item should have a logical summary
- Each line item should have a link/button to a single view page of the entity
- Each line item should have a link/button to a delete action of the relationship (doesn't delete the entity or user, just the relationship)
- The page should have a link/button to remove all associations for the particular user
- The page should have a section for stats (number of results and total number possible based on the query filters)
- The page should have logical options for filtering/sorting
 - A limit should be applied between 1 and 100 and controlled by the user (server-side enforces rules)
 - A filter with no matching records should show "no results available" or equivalent

📷 Part 1:

Progress: 100%

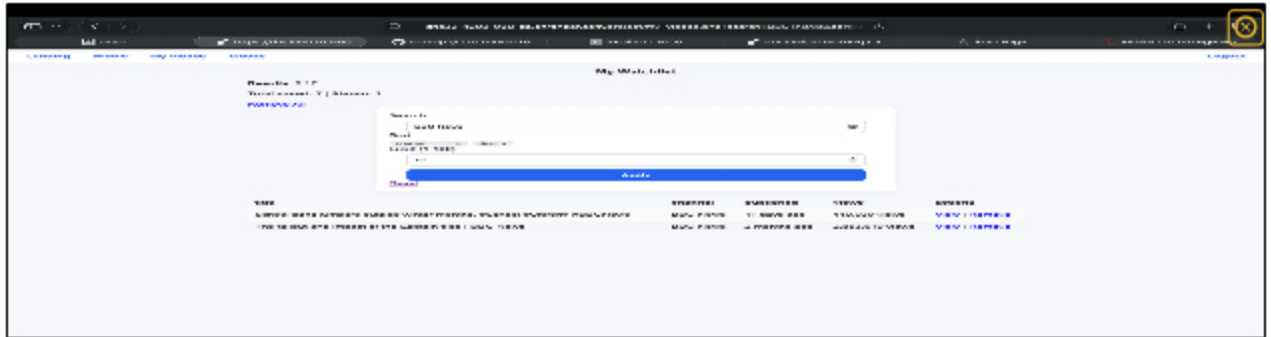

Details:

- Show a few examples of this page from Render.com qa with various filters applied
- Ensure the Render.com qa URL is visible
- Ensure each requirement is visible
- Include the code screenshots related to this page

Channel Name 97	1000000	Relationship 97	Channel Name 98	1000000	Relationship 98
Channel Name 99	1000000	Relationship 99	Channel Name 100	1000000	Relationship 100

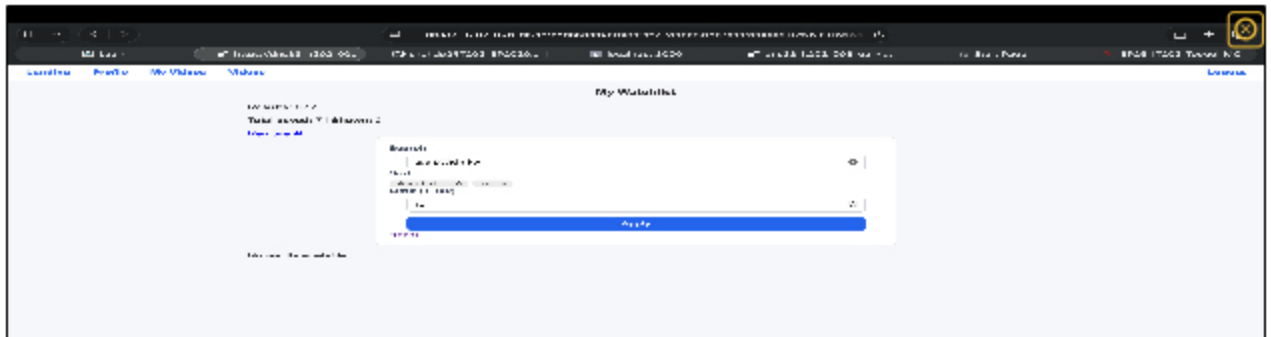

This single screenshot proves: summary rows, view link, relationship delete link, remove-all, stats, filters exist.

Proves filter works + stats respond to filter.

Sorted by channel name and views proving sorting works

No result , Proves limit control + "no results" message.

Proves relationship delete + remove all.

≡ Part 3:

Progress: 100%

Details:

- Describe how you implemented the association output
- Describe how you solved the various items required for this page (i.e., line item requirements, stats, filter/sort, etc)

Your Response:

I implemented the logged-in user's association output on my_videos.php by querying the User ↔ Video association table (IT202_M3_UserYTVideos) joined with the main video table (IT202_M2_YT_Videos). Each row in the results represents one saved relationship for the current user (WHERE uv.user_id = :uid AND uv.is_active = 1). I render the output as a simple table where each line item is a summary (title, channel name, published text, views), and each row includes a View link to the single video details page and a Remove link that deletes only the relationship (not the video).

To satisfy the required features, I added server-side filter/sort/limit controls. Search is handled with a LIKE filter on title/channel/video_id. Sorting is secured using a whitelisted sort map (e.g., title → v.title, created → uv.created) so users can't inject SQL into ORDER BY. The record limit is controlled by the user but validated server-side to be 1–100, otherwise it defaults to 10, and it is applied with LIMIT :lim. For stats, I compute Total saved using a COUNT(*) query on the association table for the current user, and Shown is computed from the number of rows returned after filters/limit. If the filters return nothing, the page displays "No results available".

Saved: 5/3/2026 5:40:01 PM

☰ Task #2 (1.50 pts.) - All Users Association Page

Progress: 100%

Details:

- Each line item should have a logical summary
- Each line item should include the username this entity is associated with
 - Clicking the username should redirect to that user's public profile
- Each line item should include a column that shows the total number of users the entity is associated with
- Each line item should have a link/button to a single view page of the entity
- Each line item should have a link/button to a delete action of the relationship (doesn't delete the entity or user, just the relationship)
- The page should have a section for stats (number of results and total number possible based on the query filters)
- The page should have logical options for filtering/sorting
 - Include a filter for partial username match to show only matching users' associated entities
 - A limit should be applied between 1 and 100 and controlled by the user (server-side enforces rules)
 - A filter with no matching records should show "no results available" or equivalent
- When a filter is applied, the page should have a link/button to remove all associations for the matching user(s)

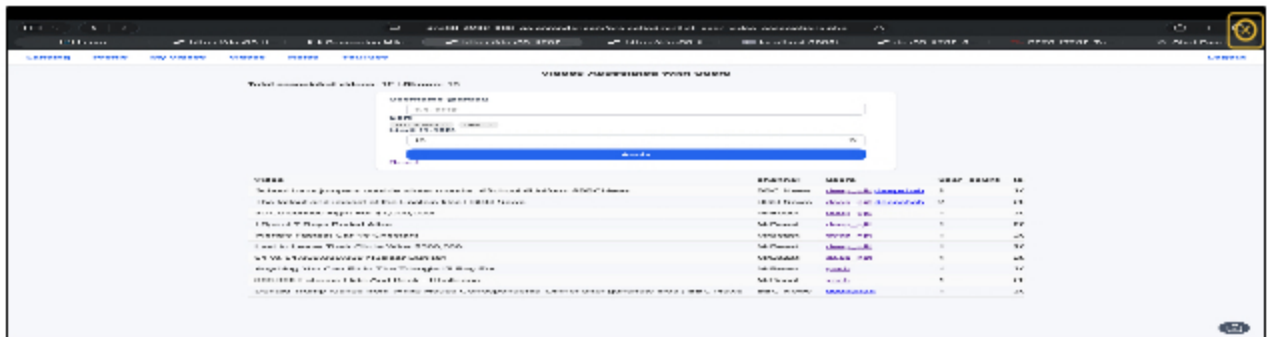

🖼 Part 1:

Progress: 100%

Details:

Details:

- Show a few examples of this page from Render.com qa with various filters applied
- Ensure the Render.com qa URL is visible
- Ensure each requirement is visible
- Include screenshots of code related to this logic including the database query

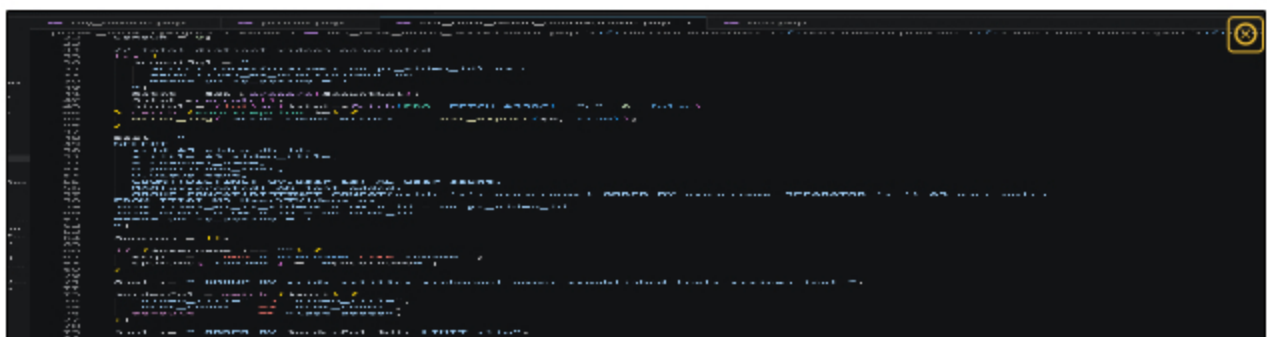

Admin association list (default view, QA)

Username filter + remove-all-by-filter button (QA)

No results state when filter returns nothing (QA)

SQL query for association list + user_count + user_pairs

To meet the worksheet requirements, the page supports filtering, sorting, limits, and stats. The username filter uses a partial match (u.username LIKE :uname) to narrow results to matching users' associated videos. Sorting is restricted to a whitelist (video_title, user_count, last_added) and applied via a safe ORDER BY mapping. The record limit is validated server-side (must be 1–100, otherwise defaults to 10) and is applied using LIMIT :lim. The header shows stats for total associated videos and shown rows based on the current filters/limit, and when no records match the filter it clearly shows "No results available."

For navigation and actions, usernames are rendered as clickable links to the public profile page using profile.php?id= (so it always targets the correct user). Each row includes a View link to the single video details page, and when a username filter is active the page shows a "Remove all for matching users" button that removes relationships for the filtered user set (it deletes the relationship records, not the users or videos).

☰ Task #3 (1.50 pts.) - Unassociated Page

Progress: 100%

Details:

- Each line item should have a logical summary
- Each line item should have a link/button to a single view page of the entity
- The page should have a section for stats (number of results and total number possible based on the query filters)
- The page should have logical options for filtering/sorting
 - A limit should be applied between 1 and 100 and controlled by the user (server-side enforces rules)
 - A filter with no matching records should show "no results available" or equivalent

🖼 Part 1:

Progress: 100%

Details:

- Show a few examples of this page from Render.com qa with various filters applied
- Ensure the Render.com qa URL is visible
- Ensure each requirement is visible
- Include screenshots of code related to this logic including the database query

SQL query -1

[illegible]

SQL query -2

The screenshot shows the 'What is connected to this device?' page in Windows Firewall. The page is titled 'What is connected to this device?' and has a subtitle 'What is connected to this device?'. The page shows a list of network connections and their status. The 'Local Area Network' connection is highlighted in blue, indicating it is the active connection. The page also shows a list of network adapters and their status.

Connection	Status
Local Area Network	Connected
Wireless Network	Disconnected
Bluetooth	Disconnected
Internet	Disconnected
Network	Disconnected
Wireless Network	Disconnected

Part 3:**Details:**

- Describe how you implemented the association output
- Describe how you solved the various items required for this page (i.e., line item requirements, stats, filter/sort, etc)

Your Response:

I implemented the unassociated output by querying the videos table and using a LEFT JOIN to the association table (IT202_M3_UserYTVideos) while filtering for rows where the join is missing (meaning the video has no active user relationship). Each row renders a short summary of the video (title/channel/published/views) and includes a View link to the single video details page.

To meet the worksheet requirements, I added server-side filter/sort/limit controls: the limit is validated to stay in the 1–100 range (otherwise it defaults to 10), sorting is restricted to a whitelist, and filtering uses LIKE for partial matches. The page also shows stats by running a separate COUNT(*) query using the same filters (but without the limit), so the header displays Total possible results and Shown results after filters/limit. If the filter returns nothing, the page displays "No results available."

Task #4 (1.50 pts.) - Admin Association Page (Like User Roles)

Details:

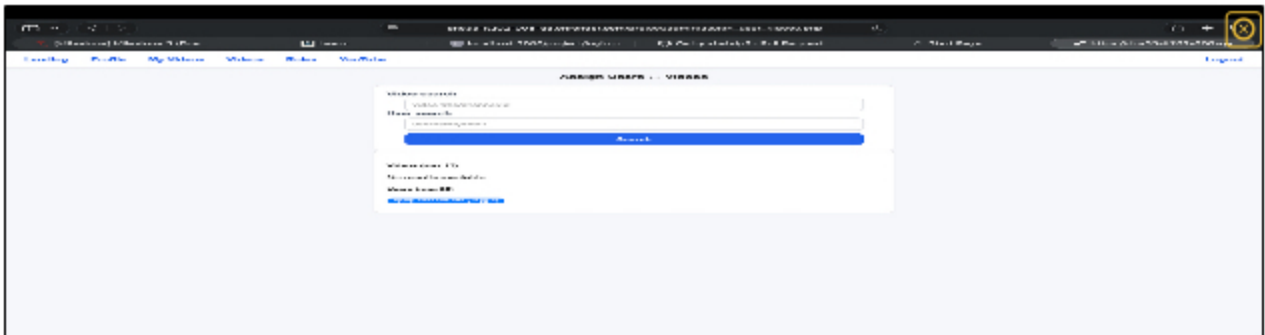

- The page should have a form with two fields
 - Partial match for username
 - Partial match for entity reference (name or something user-friendly)
- Submitting the form should give up to 25 matches of each
 - Likely best to show as two separate columns
- Each entity and user will have a checkbox next to them
- Submitting the checked associations should apply the association if it doesn't exist; otherwise it should remove the association
 - A filter with no matching records should show "no results available" or equivalent

Part 1:

Progress: 100%

Details:

- Show a few examples of this page from Render.com qa with various selections having been submitted
- Ensure the Render.com qa URL is visible
- Ensure each requirement is visible
- Include screenshots of code related to this logic including the database query

Admin association page (search form) – QA

Search results: up to 25 video + 25 user matches – QA

☰ Task #3 (0.33 pts.) - Reflection

Progress: 100%

☞ Task #1 (0.33 pts.) - What did you learn?

Progress: 100%

Details:

Briefly answer the question (at least a few decent sentences)

Your Response:

I learned how to design a many-to-many association using a join table and use it to build real features like a watchlist. I also learned that "association pages" need more than just a query, they need filtering/sorting/limits, state (shown vs total)

more than just a query, they need filtering/sorting/limits, stats (shown vs total), and safe actions that only remove the relationship instead of deleting core data. Finally, I learned why "headers already sent" happens in PHP and how to fix it by handling POST/redirect logic before outputting the navbar/HTML, using a redirect helper and stored route

⇒ Task #2 (0.33 pts.) - What was the easiest part of the assignment?

Progress: 100%

Details:

Briefly answer the question (at least a few decent sentences)

Your Response:

The easiest part was building the basic UI pages once the table existed (Videos, My Videos) because the pattern repeats: read data from the DB, render a table, and add simple links like View and Remove. Adding search/sort/limit was also straightforward after I did it once and reused the same structure. Creating the association toggle logic was simple once I confirmed the correct keys (user_id + yt_video_id) and used soft-delete style updates.

Saved: 5/4/2026 5:06:16 PM

⇒ Task #3 (0.33 pts.) - What was the hardest part of the assignment?

Progress: 100%

Details:

Briefly answer the question (at least a few decent sentences)

Your Response:

The hardest part was debugging issues caused by redirects and output order (the "Cannot modify header information / headers already sent" warnings) and making sure admin-only pages didn't break the flow. Another hard part was making sure non-admin users could still browse and save videos, because originally only admins had access to the list pages, so regular users had no UI path to create associations. Finally, getting the association pages correct (counts, username links to public profile, removing all associations for filtered users) took the most careful query work and testing.
